

Mill Plain Boulevard Interchange

Cost: \$80 Million

This project provides upgrades for vehicle and truck freight access through this heavily used urban freeway interchange.

Future growth within downtown Vancouver and the Port of Vancouver are projected to create failure at this interchange. In addition, the current geometric conditions are sub-standard for oversize load shipment into/out of the Port of Vancouver.

This project was identified as a priority interchange upgrade in the Columbia River Crossing (CRC) Project Package. However, in lieu of CRC Project construction, this interchange upgrade remains a critical need.

The scope of the project includes reconstruction of the existing interchange to address vehicular capacity needs, as well as geometric modifications to the on/off ramps to facilitate the movement of larger commercial vehicle traffic.
